SAVEETHA SCHOOL OF ENGINEERING

SAVEETHA INSTITUTE OF MEDICAL AND TECHNICAL SCIENCES

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

CSA1509 - CLOUD COMPUTING AND BIG DATA ANALYTICS

RECORD OF EXPERIMENTS

Experiments 1 - 11: SaaS Cloud Application Development using ZOHO Creater

Experiment 1: Flight Reservation System

Aim

To design and develop a simple cloud-based Software as a Service (SaaS) application for a Flight Reservation System using Google AppSheet (built on Google Cloud), incorporating fields such as One Way / Round Trip, From, To, Departure Date, Travellers & Class, Fare Type, and International / Domestic Flight options.

Procedure

1. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
2. Create the required columns in the sheet to hold the necessary fields for the Flight Reservation System: Trip type (One way / Round trip), From, To, Departure date, Travellers & Class, Fare type, International/Domestic flight.
3. Save the spreadsheet with a suitable name and note its location in Google Drive.
4. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
5. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
6. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
7. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
8. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
9. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
10. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
11. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

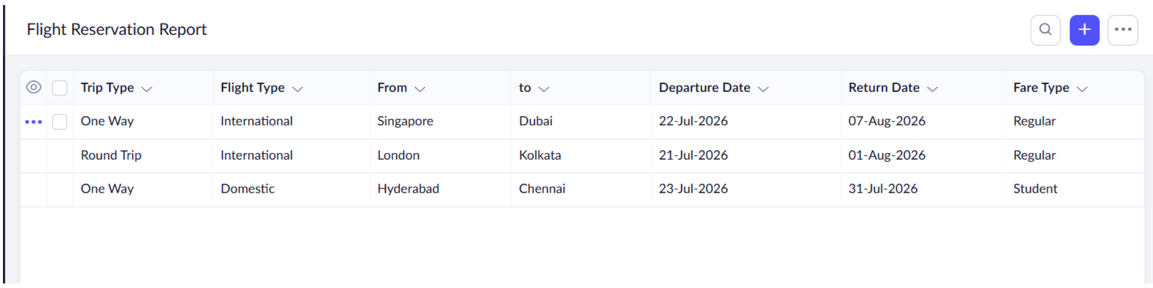
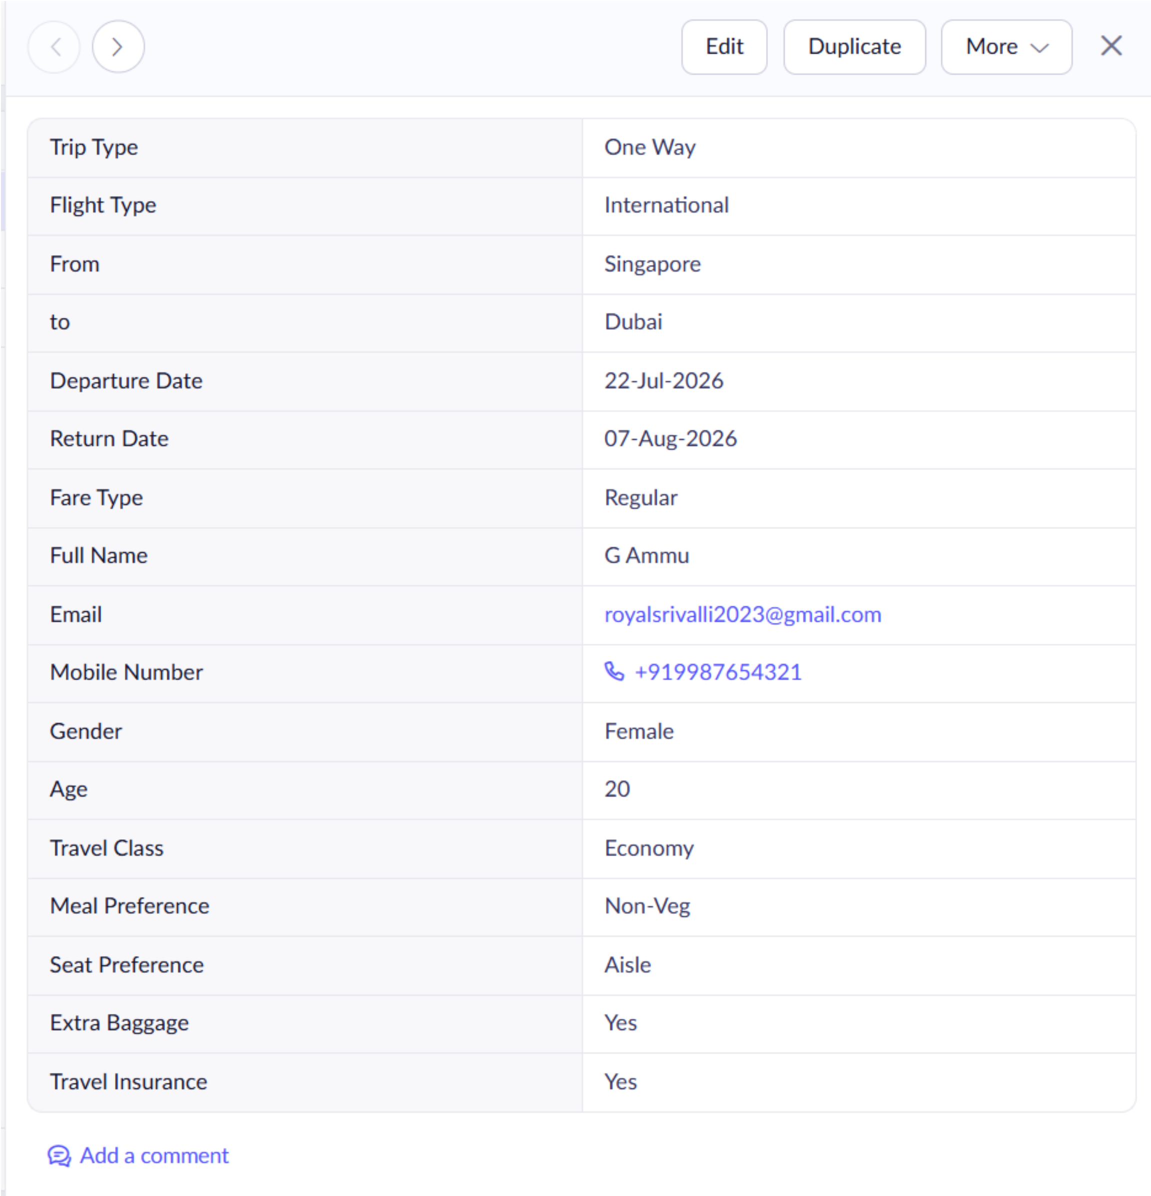
Output



Flight Reservation Report

Trip Type	Flight Type	From	to	Departure Date	Return Date	Fare Type
One Way	International	Singapore	Dubai	22-Jul-2026	07-Aug-2026	Regular
Round Trip	International	London	Kolkata	21-Jul-2026	01-Aug-2026	Regular
One Way	Domestic	Hyderabad	Chennai	23-Jul-2026	31-Jul-2026	Student



Trip Type	One Way
Flight Type	International
From	Singapore
to	Dubai
Departure Date	22-Jul-2026
Return Date	07-Aug-2026
Fare Type	Regular
Full Name	G Ammu
Email	royalsrivalli2023@gmail.com
Mobile Number	+919987654321
Gender	Female
Age	20
Travel Class	Economy
Meal Preference	Non-Veg
Seat Preference	Aisle
Extra Baggage	Yes
Travel Insurance	Yes

Result

Thus, a simple cloud-based SaaS application for the Flight Reservation System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 2: Property Buying & Rental Process (Chennai City)

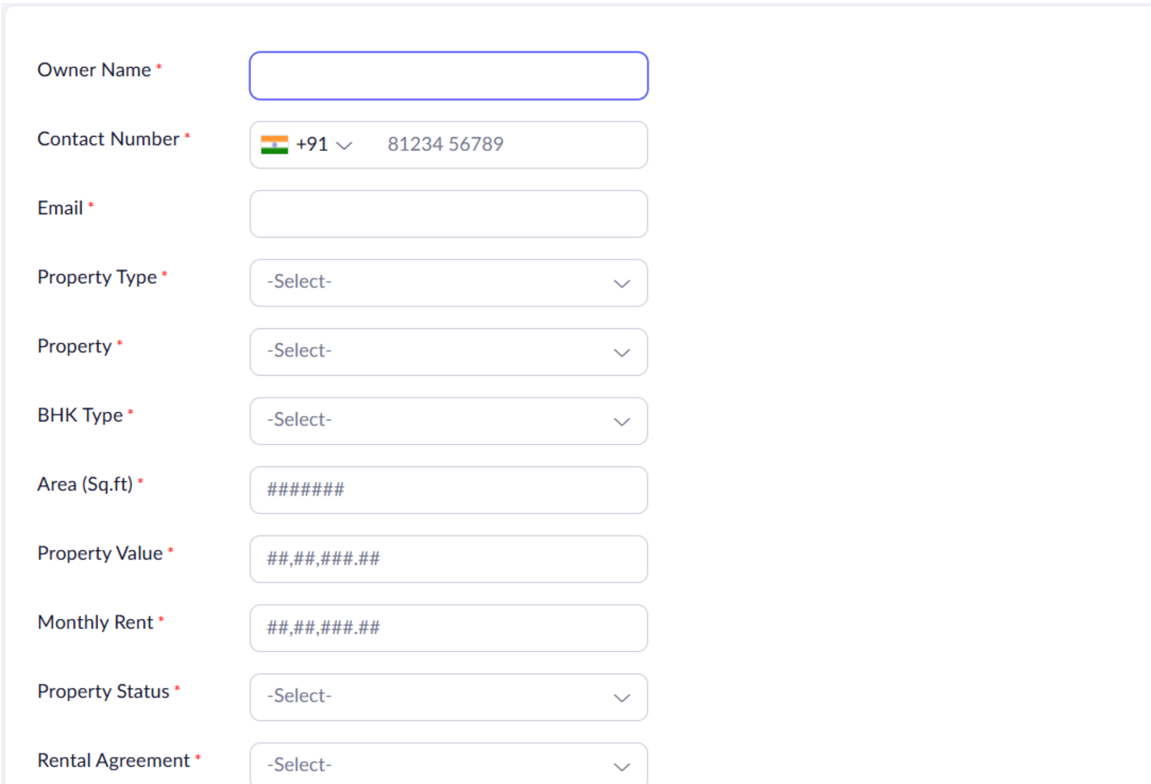
Aim

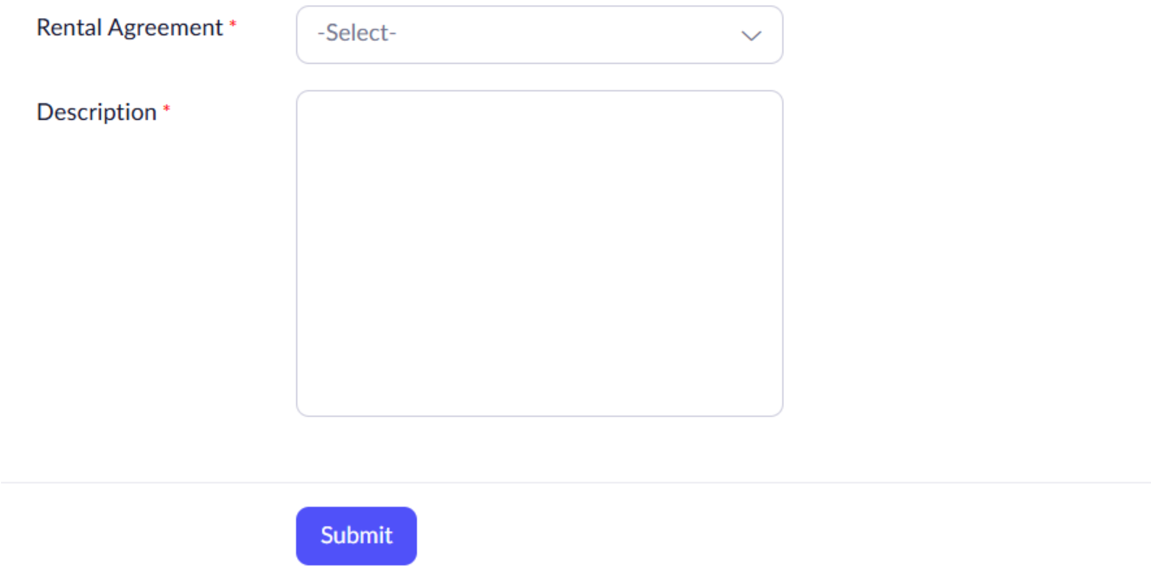
To design and develop a simple cloud-based SaaS application for a Property Buying & Rental process in Chennai city using Google AppSheet, with fields such as Buy, Rent, Commercial, Rental Agreement, Area, Place, Range, and Property Value.

Procedure

12. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
13. Create the required columns in the sheet to hold the necessary fields for the Property Buying & Rental Process (Chennai City): Buy/Rent option, Commercial type, Rental agreement, Area, Place, Range, Property value.
14. Save the spreadsheet with a suitable name and note its location in Google Drive.
15. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
16. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
17. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
18. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
19. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
20. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
21. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
22. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Input





Output

Property ID	Owner Name	Property Type	Property	Property Value	Monthly Rent	Area (Sq.ft)
23003	Anbu V	Commerical Shop	Rent	₹ 0.00000	₹ 50,000.000	800
23002	Dharshini J	Villa	Rent	₹ 0.00000	₹ 18,000.000	1000
23001	Divya J	Apartment	Buy	₹ 75,00,000.00000	₹ 0.000	1200

Property ID	23001
Owner Name	Divya J
Property Type	Apartment
Property	Buy
Property Value	₹ 75,00,000.00000
Monthly Rent	₹ 0.000
Area (Sq.ft)	1200
Rental Agreement	No
Contact Number	+919876543210
BHK Type	2 BHK
Email	192525053.simats@saveetha.com
Property Status	Available
Description	2 BHK apartment with car parking, lift, and 24/7 security.

Result

Thus, a simple cloud-based SaaS application for the Property Buying & Rental Process (Chennai City) was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 3: Car (Cab) Booking Reservation System

Aim

To design and develop a simple cloud-based SaaS application for a Car/Cab Booking Reservation System using Google AppSheet, including fields such as Search for Cabs, From, To, Rental, Out Station, Package Type, and Hours/Days.

Procedure

23. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
24. Create the required columns in the sheet to hold the necessary fields for the Car (Cab) Booking Reservation System: Search for cabs, From, To, Rental, Out station, Package type, Hours/Days.
25. Save the spreadsheet with a suitable name and note its location in Google Drive.
26. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
27. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
28. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
29. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
30. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
31. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
32. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
33. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Car (Cab) Booking Reservation System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 4: Library Book Reservation System (SIMATS Library)

Aim

To design and develop a simple cloud-based SaaS application for the SIMATS Library Book Reservation System using Google AppSheet, with fields such as Title of the Book, Author, Publications, Year, Edition, Number of Copies, Rack Number, and Status (Taken/Returned).

Procedure

34. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
35. Create the required columns in the sheet to hold the necessary fields for the Library Book Reservation System (SIMATS Library): Book title, Author, Publication, Year, Edition, No. of copies, Rack no., Status (Taken/Returned).
36. Save the spreadsheet with a suitable name and note its location in Google Drive.
37. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
38. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
39. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
40. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
41. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
42. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
43. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
44. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Library Book Reservation System (SIMATS Library) was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 5: Mark Sheet Processing System

Aim

To design and develop a simple cloud-based SaaS application for a Mark Sheet Processing System using Google AppSheet, with fields such as Student Name, Register Number, Subjects, Marks, Average, Percentage, Rank, and Overall Performance.

Procedure

45. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
46. Create the required columns in the sheet to hold the necessary fields for the Mark Sheet Processing System: Student name, Register no., Subjects, Marks, Average, Percentage, Rank, Overall performance.
47. Save the spreadsheet with a suitable name and note its location in Google Drive.
48. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
49. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
50. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
51. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
52. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
53. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
54. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
55. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Mark Sheet Processing System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 6: Payroll Processing System

Aim

To design and develop a simple cloud-based SaaS application for a Payroll Processing System using Google AppSheet, with fields such as Employee Name, Experience in Present Organisation, Overall Experience, Basic Pay, HRA, DA, TA, Net Pay, and Gross Pay.

Procedure

56. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
57. Create the required columns in the sheet to hold the necessary fields for the Payroll Processing System: Employee name, Experience (present org.), Overall experience, Basic pay, HRA, DA, TA, Net pay, Gross pay.
58. Save the spreadsheet with a suitable name and note its location in Google Drive.
59. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
60. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
61. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
62. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
63. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
64. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
65. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
66. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Income Tax	₹ 300.00
LOP	₹ 0.00
Gross Salary	₹ 11,300.00
Net Salary	₹ 10,000.00

Result

Thus, a simple cloud-based SaaS application for the Payroll Processing System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 7: Student Attendance System

Aim

To design and develop a simple cloud-based SaaS application for a Student Attendance System using Google AppSheet, with fields such as Student Name, Course, Present, Absent, Course Attendance, OD Request, Grade, and Attendance Percentage.

Procedure

67. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
68. Create the required columns in the sheet to hold the necessary fields for the Student Attendance System: Student name, Course, Present, Absent, Course attendance, OD request, Grade, Attendance percentage.
69. Save the spreadsheet with a suitable name and note its location in Google Drive.
70. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
71. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
72. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
73. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
74. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
75. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
76. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
77. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Experiment 8: Student Counselling System

Aim

To design and develop a simple cloud-based SaaS web application for a Student Counselling System using Google AppSheet, with fields such as Student Name, Age, Address, Phone, Subjects Studied, Year of Passing, Percentage of Marks, and Domain Interest.

Procedure

78. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
79. Create the required columns in the sheet to hold the necessary fields for the Student Counselling System: Student name, Age, Address, Phone, Subjects studied, Year of passing, Percentage of marks, Domain interest.
80. Save the spreadsheet with a suitable name and note its location in Google Drive.
81. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
82. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
83. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
84. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
85. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
86. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
87. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
88. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Student Counselling System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 9: Hospital Information System (SIMATS Hospital)

Aim

To design and develop a simple cloud-based SaaS application for the SIMATS Hospital Information System using Google AppSheet, with fields such as Patient Name, Age, Address, Phone, Email, Attender Name, Attender Phone, Doctor Name, and Diseases.

Procedure

89. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
90. Create the required columns in the sheet to hold the necessary fields for the Hospital Information System (SIMATS Hospital): Patient name, Age, Address, Phone, Email, Attender name, Attender phone, Doctor name, Diseases.
91. Save the spreadsheet with a suitable name and note its location in Google Drive.
92. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
93. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
94. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
95. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
96. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
97. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
98. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
99. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Hospital Information System (SIMATS Hospital) was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 10: Student Information System

Aim

To design and develop a simple cloud-based SaaS application to display student information (run using a C program on the cloud) using Google AppSheet, with the template of Student Name, Register Number, Address, Phone, Age, Courses, Grades, Attendance Report, Progress Report, and Semester Mark Sheet forms.

Procedure

100. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
101. Create the required columns in the sheet to hold the necessary fields for the Student Information System: Student name, Reg. no., Address, Phone, Age, Courses, Grades, Attendance report, Progress report, Semester mark sheet.
102. Save the spreadsheet with a suitable name and note its location in Google Drive.
103. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
104. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
105. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
106. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
107. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
108. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
109. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
110. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.

Result

Thus, a simple cloud-based SaaS application for the Student Information System was successfully designed, developed, and executed using Google AppSheet, and the desired output was verified.

Experiment 11: Online Super Market

Aim

To design and develop a simple cloud-based SaaS application for an Online Super Market using Google AppSheet, with the template of Customer Name, Address, Phone, Email, Items, Quantity, and an item-classification form.

Procedure

111. Log in to a Google account and open Google Sheets (Google Cloud) to create a new spreadsheet that will act as the backend data source for the application.
112. Create the required columns in the sheet to hold the necessary fields for the Online Super Market: Customer name, Address, Phone, Email, Items, Quantity, Item classification.
113. Save the spreadsheet with a suitable name and note its location in Google Drive.
114. Open Google AppSheet (appsheet.com) and sign in with the same Google account.
115. Click Create > App > Start with existing data, then select the Google Sheet created above as the data source.
116. Allow AppSheet to auto-detect the columns and generate the default Detail, Form, and Table views for the app.
117. Customise the generated Form view so that every required field is available for data entry, and adjust column types (Text, Number, Date, Enum, Yes/No, etc.) to match the nature of each field.
118. Arrange the Views (Form, Table/Deck, Detail) and rename the app appropriately to reflect the use case.
119. Use the AppSheet Editor's preview pane to test the app: add a new record through the Form view to demonstrate SaaS-based data entry from any device.
120. Save and deploy the app; verify that the entered data is reflected back in the linked Google Sheet, confirming that the cloud service is providing the application as a service (SaaS) without any local installation.
121. Capture the input (data-entry form) and output (saved record / list view) screens as evidence of successful execution.
